The present sequence represents a Monkey antibody light chain linked to a heavy chain. The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumour cells and in a subpopulation of normal human gastrointestinal epithelial tumour cells and in target structure especially comprises alphaébeta4 integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, in vitro, in vivo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and prognosis and monitoring premalignant conditions. Quantitative in vivo diagnosis is carried out by determining the localization of antibody to tumour deposits in humans
                                                                                                                                                                Novel antibody for diagnosis, treatment of human metastatic and malignant diseases, has binding structure for target structure displayed on cell surface of human gastrointestinal epithelial tumor and normal cells.

specific binding pair member (I) that binds a complementary specific binding pair member of encapsidating specific binding pair member/ribosome complexes in a viral coat, comprises the use of a ribosome display system Obtaining

Example 7; Page 42; 61pp; English.

The invention comprises a method (ribosome display system) for obtaining a specific binding pair (sbp) member that binds a complementary sbp member of interest. The method involves incubating mRNA molecules encoding an sbp and lacking an in-frame stop codon, allowing ribosome translation of the mRNA to produce the encoded sbp member, forming complexes comprising ribosome, mRNA, and encoded sbp member displayed on the ribosome. The ribosome display system is useful for the selection of an sbp member able to bind a complementary sbp member. The present amino acid sequence represents a GPI-linked cell surface receptor-specific VL CDR3 peptide X00000000000X8

Amplifying nucleic acid by contacting engineered nucleic acid strand having predetermined sequence at one end and sequence complementary to predetermined sequence at other end, with primer having predetermined sequence

Example 3; Fig 8e; 68pp; English.

The present invention describes a method (M1) for amplifying a nucleic acid strand. M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other, and contacting (S) with a primer having the predetermined sequence in the presence of a polymers and nucleotides under conditions suitable for polymerisation of the nucleotides. Also described is an engineered nucleic acid strand (I) having a predetermined sequence at the other end. M1 is useful for to the predetermined sequence at the other end. M1 is useful for amplifying a nucleic acid. M1 can be used for products that can be ligated into a suitable expression vector, where the vector can be used to transform an appropriate host organism to produce the polypeptide or

             of related sequences to build a complex library such as, for example an antibody library. M1 is useful not only for producing large amounts of one target nucleic acid sequence, but also for amplifying simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. ACC62635 to ACC62753 and ABRS4991 to ABRS4999 represent sequence used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BLys; B lymphocyte stimulator; TNP superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulati; immunomodulatory; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytosteatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

The BLVS gene has been mapped to chromosome 1394 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scPvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLVS or its receptor. As such, these compositions are useful for identifying immune disorders including mysathenia gravis and multiple sclerosis, inflammatory and insorders especially and relativities, infectious diseases such as AIDS and proliferative disorders including and relativities, infectious diseases such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                             ŏ
                                                              acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method the invention
administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lugus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (cvID) and

BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirhemmatic and antiAHDS activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in bloggical samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibodies against B Lymphocyte Stimulating polypeptides, useful for the
               activities such as antirheumatic, antiarthritic, neuroprofective, antinflammatory, antiasthmatic, antiallergic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence for this patent did not form part of the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences.
                                                                                                                                                                                                                       Gaps
Accordingly, they can be described as exhibiting various
                                                                                                                                                                                                                       ö

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13g34 and encodes a protein that is a member of the tumour chromosome 13g34 and encodes a protein that is a member of the tumour corrects superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable heavy (DR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods of the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as ADS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various
                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
            diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. oommon variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (BIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

for the manufacture of medicament for the treatment of cancer or

```
The invention relates to a novel c-Met protein tyrosine kinase antibody or its antigen binding portion that specifically binds to c-Met. The c-Met antibody comprises any one of 1-60 fully defined sequence of 238, 244, 240, 250, 251, 242, 245, 247, 246, 253, 249, 243, 241, etc., amino acids as given in the specification, or its fragment. The invention comprises a pharmaceutical composition comprising the c-Met protein tyrosine kinase antibody and a carrier; an isolated call that produces the c-Met protein tyrosine kinase antibody; and an isolated nucleic acid molecule that comprises a nucleic acid sequence that encodes a heavy chain or its antigen-binding portion of the c-Met protein tyrosine kinase antibody and an aciden-binding portion of the c-Met protein tyrosine kinase antibody. The c-Met protein tyrosine kinase antibody are cybthalmological, antiinflammatory, analgesic, vasotropic, antibody is and osteopathic activities. The c-Met protein tyrosine kinase antibody is
                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           c-Met, tyrosine kinase antibody; antigen binding; cytostatic; ophthalmological; antiinflammatory; analgesic; vasotropic; antipsoriatic; osteopathic; cancer; tumour; ophthalmic disease; glaucoma; retinitis; retinopathy; uveitis; ocular photophobia; macular degeneration; pain; acute injury; eye; hyperproliferative disorder; restenosis; angioplasty;
                   antiinflammatory, antiasthmatic, antiallergic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel c-Met protein tyrosine kinase antibody or its antigen-binding portion specifically binding to c-Met, useful for manufacture of medicament for treating cancer or tumor and for treatment of ophthalmic

                       tumour. The c-Met protein tyrosine kinase antibody is useful for diagnosing the presence or ligation of c-Met expressing tissue. The c-Met protein tyrosine kinase antibody is useful for detecting c-Met in a biological sample in vitro or in vivo. The c-Met protein tyrosine kinase antibody is also useful in the treatment or prevention of ophthalmic diseases such as glaucoma, retinitis, retinopathies (e.g., diabetic retinopathy), uveitis, ocular photophobia, macular degeneration and pain associated with acute injury to the eye. The pharmaceutical composition is useful for the treatment of hyperproliferative disorders such as restenosis after angloplasty, and psoriasis, and for the treatment of animals that lack sufficient HGF, e.g. osteoporosis and cancer.                                                                                                                                                                                                                                                                                                                                                               sequence represents the protein of a phage display generated human c-Met antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes human proteins with cancer suppressing activity. Also described are the polynucleotides encoding the proteins and a process for preparing the proteins by DNA recombination. The proteins and polynucleotides can be used in the treatment of diseases such as cancer. The present sequence represents a human cancer suppressing protein from the present invention

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Claim 1; Page 2763-2764; 3148pp; English.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of the invention

Ä Vaughan TJ, Hilbert Choi GH, Barash SC, Ruben SM,

WPI; 2003-505530/47.

Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

Example 1; SEQ ID NO 1980; 394pp; English.

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13d3 and encodes a protein that is a member of the tumour chromosome 13d3 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single consists and methody molecules (scYvs) derived, preferably, from the variable crossent invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, inflammatory constructions are useful for identifying immune disorders as AIDS and proliferative disorders including leukamia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiarthritic, neuroprofective, antiritammatory, antiasthmatic, antiarthritic, neuroprofective, antiritammatory, antiasthmatic, antiallergic and cytostatic. This collypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences

```
The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polymucleotides cells), comprising using a library of two different polymucleotides concoding different immunoglobulin binding protein (1gBP) polypeptides that peptides in transferded cells, to generate an IgBP that binds to a ligand, and transformed plant cells are selected, and preparing an IgBP carray in plant cells. At least one peptide sequence has at least 75% sequence identity to a framework region (RR) of a native IgM, IgG, IgM, IgD, IgB, IgY, kappa or lambda immunoglobulin molecule. The method is cueful for preparing an immunoglobulin binding protein array, preferably heavy chain binding protein (CHBP) array in eukaryotic cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for discovery of e.g. screening assays of IgBPs having desired characteristics. The present sequence is a mammalian immunoglobulin cerived peptide that may be incorporated into an IgBP of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparing immunoglobulin binding protein array in plant cells by transforming the cells with different polynucleotides encoding binding protein polypeptides specific to ligand, selecting plant cells for

The present invention describes an isolated polymucleotide (1) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a dram-positive bacterium. Also described: (1)
an isolated polypeptide that is encoded by the polymucleotide (1), its
complement, despensate variant or fragment; (3) a genetically engineered
complement, despensate variant or fragment; (3) a genetically engineered
composition comprising the polypeptide of (1); (5) an immunogenic
composition comprising the polypeptide of (1); (5) an immunogenic
composition comprising the polymucleotide that is comprised in the
expression vector; (6) a pharmaceutical composition comprising the
copyeptide of (1) and a carrier; (7) a protein chip comprising the
copyeptide of (1) and a carrier; (7) a protein chip comprising an array
of the polypeptides of (1), their biological equivalent or fragment; (8)
immunogenic composition; (9) detecting and/or identifying Alloiococcus
cutridis in the biological sample; (10) a kit comprising a nontainer
containing the novel polymucleotide, its degenerate variant or fragment,
containing the novel polymucleotide, its degenerate variant or fragment
containing the novel polymucleotide, its degenerate variant or produce the
polympetide from the culture. (1) can be used in gene therapy. The
polymucleotides, polypeptides, antibodies and compositions of the present
corrections and monitoring of effects during drug clinical trials.
The polymucleotides are useful for expressing and detecting Alloiococcus
cutridis. The present sequence represents an Alloiococcus otitidis
contraining resumer inventer on a place of the present sequence represents an Alloiococcus
cotitidis. The pareams requesting and detecting Alloiococcus
cotitidis. The pareams the present sequence represents an Alloiococcus otitidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This polypeptide sequence comprises the VL domain of human scFv antibody 1046, which is specific for transforming growth factor (TGF) beta-1. It is encoded by a gene (AAT60384) isolated from a peripheral blood Immediate binding domains of human antibodies (see AAW15522-40) to TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, ocular or keloid scarring, lung fibrosis, arterial injury, proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrhosis, post myocardial infarction, post-angioplasty restenosis, scleroderma, vascular disorders, cataract, glaucoma, or esp. restenosis, scleroderma, vascular disorders, cataract, glaucoma, or esp. or (ii) immune and inflammatory diseases (e.g. rheumatoid arthritis, macrophage deficiency diseases or macrophage pathogen infection). Nucleic cides encoding human antibody VH and VL can be used for prodn. of recombinant antigen-binding domains. These are highly specific, have low dissociation constants (pref. less than 5 nM) and low IC50s for
                                                                                                                                                                                     Transforming growth factor beta-1; TGF-beta-1; human; antibody engineering; scFV; phage display; Jung fibrosis; arterial injury; proliferative retinopathy; retinal detachment; adult respiratory distress syndrome; liver cirrhosis; post engoladial infarction; post-angioplasty restencesis; scleroderma; vascular didease; cataract; glaucoma; scarring; glomerulonephritis; osteoporosis; immune disease; inflammation; rheumatoid arthritis;

Synthetic genes, for both heavy and light chains may be created by combining selected CDR 1, 2, and 3 regions, which may be selected from different antibody mols. having varied binding specificity. The chimaeric anti-RhD antibodies can be used for diagnosis and therapy, and are capable of providing blood- typing reagents of high specificity and reliability. They can also be used in passive immunisation to prevent haemolytic disease of the newborn. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PA

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAL

TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

FILE REPERENCE: 107196-1132

CURRENT PAPLICATION NUMBER: US/09/248,796A

CURRENT FILING DATE: 1999-02-12

PRIOR APPLICATION NUMBER: US 60/074,725

PRIOR APPLICATION NUMBER: US 60/096,409

PRIOR FILING DATE: 1998-02-13

PRIOR FILING DATE: 1998-08-13

PRIOR FILING DATE: 1998-08-13

PRIOR FILING JATE: 1998-08-13

SEQ ID NO 20780

LENGTH: 345
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

NESOLIA (1980)

1. Sequence 8308, Application US/09949016

2. Sequence 8308, Application US/09949016

3. Patent No. 6812339

4. GENERAL INFORMATION:

5. TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

7. TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

7. TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

7. FILE REPERENCE: CL001307

7. CURRENT APPLICATION NUMBER: 60/241, 755

8 PRIOR PILING DATE: 2000-10-20

7. PRIOR APPLICATION NUMBER: 60/231, 498

8 PRIOR APPLICATION NUMBER: 60/231, 498

8 PRIOR PILING DATE: 2000-09-08

8 NUMBER OF SEQ ID NOS: 207012

8 SEQ ID NOS: 207012

8 SEQ ID NO SI 207012

8 SEQ ID NO SI 207012

Patent No. 6083748

GENERAL INFORMATION:
APPLICANT: Cheng, Jill
APPLICANT: Lasky, Laurence A.
TITLE OF INVENTION: A NOVEL KAPPA/MU-LIKE PROTEIN TYROSINE
TITLE OF INVENTION: PHOSPHATASE, PTP LAMBDA
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSER: FLEHR, HOHBACH, TEST, ALBRITTON & HERBERT, LLP
STREET: 4 Embarcadero Center, Suite 3400
                                                                                                                                        Sequence 4, Application US/08769399
Patent No. 5976852

yopE chaperone sycE - Yersinia pestis plasmid pCD1

C;Species: Yersinia pestis
C;Species: Yersinia pestis
C;Date: 21-Jan-2000 #sequence_revision 21-Jan-2000 #text_change 09-Jul-2004
C;Accession: T43606; T42911
C;Accession: T43606; T42911
J: Bacteriol. 180, 5192-5202, 1998
A;Title: Structural organization of virulence-associated plasmids of Yersinia pestis.
A;Reference number: 222578; MUID:98422474; PMID:9748454
A;Accession: T43506
A;Status: preliminary; translated from GB/EMBL/DDBJ

A;Molecule type: DNA* XResidues: 1-130 «HUP» A;Cross-references: UNIRROT: P31491; EMBL:AF053946; NID:g2996222; PIDN:AAC62588.1; PID:g2 A;Experimental source: strain KIM

Perry, R.D.; Straley, S.C.; Fetherston, J.D.; Rose, D.J.; Gregor, J.; Blattner, F.R. fifect. Immun. 66, 4611-4623, 1998
Title: DNA sequencing and analysis of the low-ca2+-response plasmid pCD1 of Yersinia F. Reference number: Z22273; MUID:98427122; PMID:9746557

A;Status: preliminary; translated from GB/EMBL/DDBJ A;Molecule type: DNA

A;Residues: 1-130 <PER> A;Cross-references: EMBL:AF074612; NID:g3822037; PIDN:AAC69819.1; PID:g3822099 A;Experimental source: strain KIMS

A;Genome: plasmid pCD1 C;Superfamily: Yersinia pestis plasmid pCD1 hypothetical protein sycE

"Nucleotide sequence and predicted functions of the entire
Sinorhizobium meliloti pSymA megaplasmid.",
Proc. Natl. Acad. Sci. U.S.A. 98:9883-9888(2001).
-! FUNCTION: This protein may play a role in the biosynthesis of the
prosthetic group of nitrogenase (Few cofactor).
-!- PATHWAY: Fe-Mo cofactor biosynthesis.
-!- SIMIARITY: BELONGS TO THE NIFD/NIFK/NIFE/NIFN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                    Nature 387:394-401(1997).

-!- FUNCTION: This protein may play a role in the biosynthesis of the prosthetic group of nitrogenase (FeMo cofactor).

-!- PATHWAY: Re-Mo cofactor biosynthesis.

-!- SIMILARITY: BELONGS TO THE NIFD/NIFK/NIFE/NIFN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

"If surface. Is also secreted in either cleaved or uncleaved form to mediate signaling to other cells (By similarity).
"If condition activity to the C-terminal of the newly generated Natl. Insignate (N-product). This covalent actachment of a cholesterol moiety to the C-terminal of the newly generated Natl. Insigned (N-product). This covalent modification appears to play an essential role in restricting the spatial distribution of the protein activity to the cell surface. The N-product is the activity special series in both local and long-range signaling, whereas the C-product has no signaling activity (By similarity).
"If active species in both local and long-range signaling, whereas the C-product has no signaling activity (By similarity).

Monoamine-sulfating phenol sulfortansferase (EC 2.8.2.1)
(Sulfotransferase, monoamine-preferring) (M-PST) (Thermolabile phenol sulfotransferase) (TL-PST) (Placental estrogen sulfotransferase)
FUNCTION: Catalyzes the sulfate conjugation of catecholamines, phenolic drugs and neurotransmitters. Is also responsible for the sulfation and activation of minoxidil. Mediates the metabolic activation of carcinogenic N-hydroxyarylamines to DNA binding products and could so participate as modulating factor of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

TISSUB SPECIFICITY: Liver, colon, kidney, lung, brain, spleen, small intestine, placenta and Leukocyte.
PIM: The N-terminus is blocked.
SIMILARITY: Belongs to the sulfotransferase family.
                                                                                                                                                                                                                                                                                                                                                                MEDLINE=94379981; PubMed=8093002; Veronese M.E., Burgess W., Zhu X., McManus M.E., Veronese M.E., Burgess W., Zhu X., McManus M.E., that oncomen characterization of two human sulphotransferase cDNAs that encode monomaine- and phenol-sulphating forms of phenol sulphotransferase: substrate kinetics, thermal-stability and inhibitor-sensitivity studies."; Biochem.                                                                                                                                                                                                                                                                  Aksoy I.A., Callen D.F., Apostolou S., Her C., Weinshilboum R.M., "Therwolabile phenol sulfotransferase gene (STM): localization to human chromosome 16p11.2.", Genomics 23:275-277(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and phenolic and cathecol drugs.

ANALYTIC ACTIVITY: 3'-phosphoadenylylsulfate + a phenol = adenosine 3',5'-bisphosphate + an aryl sulfate.

SUBUNIT: Homodimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MIM; 600641; -.

Ogura K., Satsukawa M., Okuda H., Watabe T.;
Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes the sulfate conjugation of catecholamines and phenolic drugs and neurotransmitters (By similarity).
-!- CATALYTIC ACTIVITY: 3'-phosphoadenylylsulfate + a phenol = adenosine 3',5'-bisphosphate + an aryl sulfate.
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
